OB anterior

This image shows a fluorescence microscopy scan of a brain section. Two distinct, bright blue fluorescent spots are visible, positioned symmetrically on either side of a central vertical axis. A horizontal white line and a vertical white line intersect at the center of the image, forming a crosshair that serves as a reference for the anatomical orientation. The spots appear to be located in the midline region of the brain, possibly representing the thalamus or a similar structure. The background is dark, indicating low fluorescence in the surrounding tissue.
